

You must write a C++ program that uses the airtraffic2017 tables you created and modified in assignments 9 and 10. This means that each of you should have different output!

List each flight – number, origination, destination and miles followed by each of the passengers on that flight. Write a summary line after each flight that has the total number of passengers on the flight. Run your program piping the output to a file and turn in both the source code and the output on Blackboard.
